

Sunday Roast — Complete Menu

Serves 3 (2 carb-moderate adults + teen) · 1.18 kg compact tied MB3+ rib eye, 12 cm dia · Service 7:05pm, Sun 12 Jul · Register: classic, generous, restrained

Menu

- Rib eye roast (reverse sear)
- Duck-fat roast potatoes (split-roast)
- Honey-glazed carrots (light honey)
- Green beans, butter + lemon zest
- Horseradish cream
- Red wine jus (staged)

Critical Path

Potato pre-roast → beef low roast → beef rest (potato recrisp overlaps) → potato out → oven to max → beef blast → carve. Single Bosch oven; every oven transition is gated by the oven reaching temperature, not by elapsed time — the clock is the planning path, not a guarantee. Horseradish is made ahead and never gates service.

Failure prioritization: Protect beef core temp and the final potato crisp. Governing rule — the beef's 40-min rest ceiling outranks potato recrisp duration and nominal service time. If a transition compresses the recrisp, pull potatoes at achieved crust; the beef blast does not wait.

Oven Sequencing (single Bosch — state-gated)

- 450°F / 230°C — potato pre-roast. Potatoes enter only once the oven actually reads 450°F.
- 250°F / 121°C — beef low roast. After pre-roast, drop the setting and briefly vent the door (450 → 250 with door shut is slow); beef enters only once near 250°F.
- ≥425–450°F / 220–230°C — potato recrisp. Begins once genuinely recovered.
- Max / 500°F — beef blast. Begins once the oven reaches actual max.

Parallel vs. Sequential

- Parallel: carrots (induction 1), beans blanch-then-hold (induction 2), jus on outdoor gas burner (keeps both induction burners free). Horseradish done ahead.
- Sequential (oven-bound): potato pre-roast → beef low → potato recrisp → beef blast. One owner at a time.

T-Minus Timeline

Planning path, 7:05pm service. Beef pull temp is the master trigger; oven transitions are temperature-gated. The clock is the on-time estimate — the trigger band below governs deviation.

Time	Action
Sat evening	Cut + re-tie roast done, 1.18 kg. Dry-brine 12 g Diamond Crystal (1%), uncovered on rack, fridge, ~24 hr
3:45 pm	Beef out of fridge (~70 min before roasting — takes surface chill off; do not wait for center to reach room temp). Make horseradish if not done
3:55 pm	Oven → 450°F. Parboil potatoes (baking soda), drain, rough, dry
~4:05 pm	Once oven reads 450°F: potatoes pre-roast, aim to finish ~4:40–4:45 — pale gold, set, not yet deeply crisp
~4:40–4:45 pm	Potatoes out → hold uncovered, single layer, wire rack, room temp. Drop oven to 250°F, vent door briefly. (If beef start shifts later, delay the pre-roast rather than hold potatoes past 2 hr.)
4:45 pm	Jus stage 1: brown 1 sliced shallot (+ optional trimmings) in a little oil on outdoor gas; deglaze with wine, reduce by half; add stock, brief simmer, then off heat, covered
4:50 pm	Beef: pat bone-dry, oil, pepper, insert probe (alarm 116°F)
~4:55 pm	Once oven near 250°F: beef in (~75–80 min, probe-governed)
6:05 pm	Jus stage 2: return to gas, finish stock reduction to a light nappe. Begin watching probe
6:15 pm	Beef pulls at 119–120°F. Onto rack, rest uncovered. Oven → back up to 450°F. Fold low-roast drippings into jus
~6:28–6:30 pm	Once oven ≥425–450°F: potatoes back in, recrisp ~15–20 min — pull when deeply golden and audibly crisp, turning once. Watch the garlic/thyme
6:35 pm	Carrots on induction 1; bean water to boil on induction 2
~6:40–6:43 pm	Jus stage 3: add drippings, strain, mount 20 g cold butter, hold warm on lowest gas. Blanch beans 4 min, shock, drain, hold
~6:48 pm	Potatoes out at achieved crisp → hold on rack, room temp. Oven → max
~6:54 pm	Once oven at max: beef in, blast 5–8 min, crust-color-governed
6:57 pm	Toss beans butter + zest, low induction. Plate carrots
~7:00–7:02 pm	Beef out when crust set. Thermapen-verify ~127–133°F. Add final-blast drippings to jus
7:05 pm	Handling done — carve against grain. Plate; jus + horseradish to table

Trigger band (governs deviation)

- Pull 6:14–6:20: normal path, hold ~7:05 service.
- Pull 6:10–6:13: advance potato exit, oven-to-max, and blast by the matching minutes; potatoes accept a shorter recrisp.
- Pull before 6:10: advance the whole final sequence, accept earlier service. Don't extend the rest to protect 7:05.
- Pull after 6:20: shift service later; carrots and beans wait, beef doesn't.

Verification: Beef rest 6:15 → ~6:54 = ~39 min, under 40 ✓. Potato recrisp sensory-governed ~15–20 min ✓. Jus staged with hold, not continuously reduced ✓. Blast + handling → 7:05 carve ✓. Transitions state-gated, none assumed instantaneous ✓.

Holding Chain

Component	Hold Strategy	Max Hold	Drift Risk	Corrective
Beef	Rack, uncovered, room temp	40 min	Over-rest cools core	Blast reheats surface; Thermapen-verify post-blast
Potatoes (pre-roast)	Wire rack, room temp, single layer	~2 hr	Surface dries (harmless)	Recrisp restores; never stack/cover
Potatoes (final)	Wire rack, room temp, single layer	~10 min	Crust softens	Uncovered, never cover
Carrots	Covered pan, residual heat	15 min	Glaze tightens	Loosen with splash of water off-heat
Green beans	Drained, dry, room temp	15 min	Lose gloss	Butter + zest toss at 6:57
Jus	Warm, lowest gas	30 min	Over-reduces	Loosen with stock; re-strain
Horseradish	Fridge, covered	Days	None	Serve cold

Shared Prep

Lemon: zest 1 → beans; juice → reserve for adjustments (horseradish, carrots, jus).

Butter (cold, cubed): 60 g total — 20 g → jus mount, 20 g → carrots, 20 g → beans.

Diamond Crystal salt: 12 g → beef brine (Sat); remainder to season potatoes/carrots/beans to taste.

Jus base: 1 sliced shallot browned in a little oil (default); beef trimmings optional additive.

Sourcing: Ask the butcher for trimmings when collecting the roast — free jus-base boost. Horseradish cream: taste before adding lemon or salt — prepared horseradish carries its own vinegar and salt.

1 · Rib Eye Roast (Reverse Sear)

Yield: serves 3 with leftovers · Total ~3.5 hr incl. temper · Active ~25 min · Oven 250°F → max

MB3+ boneless rib eye roasted low to an even medium-rare, then blasted hot for a single deep crust. Uniform rosy interior wall-to-wall, deep-browned exterior, beef unmasked. Crust built once, at the end.

Ingredients

Ingredient	Amount
Rib eye roast (MB3+ Black Angus, compact tied, 12 cm dia)	1.18 kg / 2.6 lb
Diamond Crystal kosher salt	12 g (1% of weight)
Neutral oil	1 tbsp
Black pepper, freshly cracked	to taste
Thyme sprigs (optional)	2–3

Flavor Architecture

Element	Definition
Base	Rendered beef fat + oil film for sear conduction
Primary driver	The beef — MB3+ marbling; no competing element
Acid	None in the roast — externalized to horseradish + jus (meal-level)
Aromatic/finish	Black pepper; thyme background

Meal-level carve-out: acid provided by horseradish and jus, not the roast.

Texture

Two distinct — yielding interior vs. crisp-browned crust. The final blast is the entire crust mechanism.

Prep Phase

1. Sat: cut + re-tie done, 1.18 kg. Salt all surfaces evenly (12 g). Rack, uncovered, fridge, ~24 hr — dries surface, seasons deep. 1% is moderate and sufficient; the meat needs no finishing salt by default — taste a slice first.
2. 3:45pm Sun: out of fridge, ~70 min before roasting — takes the surface chill off; do not wait for the center to reach room temp. Pat bone-dry before roasting.
3. 4:50pm: rub with 1 tbsp oil, crack pepper all over. No additional salt.

Active Cooking

1. Oven 250°F / 121°C. Leave-in probe (ThermoWorks) into thickest center, alarm 116°F.
2. Roast to pull — probe-governed (~75–80 min; 12 cm diameter drives this, not weight). Pull at 119–120°F / 48–49°C.
3. Rest uncovered on rack ~39 min (40 min ceiling). Oven → 450°F for potato recrisp, then → max in the final minutes.
4. Final blast: into max oven (500°F / 260°C), 5–8 min, crust-color-governed. A 1.18 kg roast climbs fast — watch it.
5. Verify: Thermanen the center post-blast. Expect ~127–133°F / 53–56°C — verify, don't assume a fixed rise. The probe number is the truth.

Holding & Assembly

Off the blast, 2–3 min handling/transfer (not a formal rest — the pre-blast rest already redistributed juices). Carve against the grain, ~1 cm. Jus + horseradish to table.

Critical Control Points

Severity	Failure Mode & Cue	Recovery
Critical	Overshoot core — pulled too high or blasted too long. Cue: Thermanen >133°F post-blast → past medium-rare, grey band	Unrecoverable. Prevention: pull 119–120°F, blast by crust color not clock, verify with Thermanen
Major	Weak crust — surface not dry, or oven didn't recover to max. Cue: pale exterior after blast	Extend blast 1–2 min watching center; if core near limit, accept lighter crust (serviceable)
Minor	Off-center probe → uneven read. Cue: one end more done	Cosmetic — serve to preference

Adjust: The meat is moderately salted from the brine — taste a slice before any finishing salt; jus and horseradish also carry salt. If flat, a few flakes at the plate, not the board.

Sunday Roast

Scaling Notes: Diameter governs low-roast time more than weight — 12 cm compact runs ~75–80 min. A long/narrow roast of the same weight runs faster with more crust. Below 1 kg, drop blast to 4–5 min.

2 · Duck-Fat Roast Potatoes (Split-Roast)

Yield: serves 3 · Total ~55 min across two phases · Active ~15 min · Oven 450°F / 230°C

Parboiled potatoes pre-roasted to set, held, then recrisped during the beef rest — a shattering craggy crust and fluffy interior in duck fat. Baking soda in the parboil raises surface pH so the exterior crisps aggressively. The split solves the single-oven bottleneck.

Ingredients

Ingredient	Amount
Potatoes (Yukon Gold or Maris Piper), peeled, ~4 cm chunks	700 g / 1.5 lb
Duck fat	4 tbsp / 60 g
Baking soda	¼ tsp
Salt	to taste
Garlic, smashed (optional); thyme (optional)	2 cloves

Flavor Architecture

Element	Definition
Base	Duck fat (roasting medium + flavor)
Primary driver	Potato + duck fat richness
Acid	None — externalized to meal
Aromatic/finish	Garlic + thyme in the fat; salt at finish

Single-stage acceptable: no acid by design; richness component, acid externalized.

Texture

Two distinct — craggy crisp shell vs. fluffy interior, via baking-soda parboil + roughing-up.

Prep Phase

1. Peel (skin blocks crust and steams under the fat). Even ~4 cm chunks.
2. Parboil in salted water + ¼ tsp baking soda, ~8 min from boil, until edges just soften.
3. Drain thoroughly, dry in the hot pan 30 sec, then shake hard in the colander to rough the surfaces — roughed edges become the crust.

Active Cooking

1. Pre-roast: heat duck fat in the tray in the 450°F oven ~5 min until shimmering. Add potatoes (dry — spatter risk), turn to coat, add garlic/thyme if using. Roast to pale gold and structurally set, ~25–30 min. Remove; hold uncovered, single layer, wire rack, room temp.
2. Recrisp: once the oven has recovered to ≥425–450°F during the beef rest, return potatoes ~15–20 min, turning once, until deeply golden and audibly crisp. Salt out of the oven.

Holding & Assembly

Pre-roasted potatoes hold up to ~2 hr on the rack, room temp. Final crisped potatoes hold ~10 min. Never stack or cover at any stage — trapped steam softens the crust instantly.

Critical Control Points

Severity	Failure Mode & Cue	Recovery
Major	Soft, greasy — fat not hot at entry, or crowded tray. Cue: pale, oil-slicked	Spread out, raise to 475°F, extend. Prevention: fat shimmering before entry; single layer
Major	Over-browned crags / scorched garlic on recrisp — too long at true 450°F. Cue: dark bitter edges, acrid garlic	Recoverable for potatoes (pull immediately); discard scorched aromatics. Prevention: sensory-govern the recrisp, pull when golden not dark
Minor	Over-roughed → mushy exterior. Cue: edges disintegrate on turning	Cosmetic — still crisps

Adjust: Salt only out of the oven — earlier salt draws moisture, softens crust. Undercrisp at service → a few more minutes, but this competes with the beef blast; accept as-is if the beef needs the oven.

Scaling Notes: Do not crowd — potatoes need space. Above 700 g, use two trays or the crust fails across the batch.

3 · Honey-Glazed Carrots (Light Honey)

Yield: serves 3 · Total ~20 min · Active ~15 min · Induction

Carrots glazed in butter with a restrained touch of honey to a tender-yielding bite and light gloss — the warm sweet-soft counterpoint to the beef, honey held to 1 tsp so it doesn't stack richness against the wine.

Ingredients

Ingredient	Amount
Carrots, peeled, ~5 cm batons	400 g / 14 oz
Butter	20 g
Honey (or omit; glaze on butter + salt alone)	1 tsp
Salt	to taste
Water	~50 ml
Lemon juice, optional squeeze (reserved)	—

Flavor Architecture

Element	Definition
Base	Butter
Primary driver	Carrot sweetness, lightly lifted by honey
Acid	Optional lemon squeeze at finish — corrective, pulls back sweetness if cloying
Aromatic/finish	Salt; optional pepper

Acid single-stage at finish justified: glaze reduction; acid's role is corrective, not structural.

Texture

Meal-level texture exemption — glazed carrots are inherently soft; contrast provided by crisp potatoes and beef crust across the plate.

Prep Phase

1. Peel (skin turns leathery and bitter under a glaze). Even ~5 cm batons.

Active Cooking

1. Carrots, butter, 1 tsp honey, ~50 ml water, pinch salt in a pan on induction 1. Cover, medium, ~8 min until a knife meets slight resistance.
2. Uncover, raise heat, reduce to a glossy glaze, ~4–5 min. Toss to coat.
3. Taste — if even slightly cloying, small squeeze of lemon.

Holding & Assembly

Cover, hold on residual heat up to 15 min. Glaze tightens — loosen with a splash of water off-heat before plating.

Critical Control Points

Severity	Failure Mode & Cue	Recovery
Major	Glaze breaks/scorches — reduced too hard. Cue: fat separates, brown flecks, acrid smell	Unrecoverable if scorched. Prevention: reduce over medium, pull when glossy not sticky
Minor	Undercooked core. Cue: knife meets hard resistance	Splash water, cover, 2–3 min more

Adjust: Too sweet → lemon squeeze. Flat → pinch of salt sharpens. Don't add honey at the end — won't integrate off-heat.

Scaling Notes: Not applicable.

4 · Green Beans, Butter + Lemon Zest

Yield: serves 3 · Total ~12 min · Active ~8 min · Induction

Blanched green beans, shocked to hold color and bite, finished with butter and lemon zest for aromatic lift. The palate-resetting fresh-firm element against the rich plate.

Ingredients

Ingredient	Amount
Green beans, trimmed	300 g / 10 oz
Butter	20 g
Lemon zest, from 1 lemon (shared)	—
Salt	to taste
Garlic, sliced (optional)	1 clove

Flavor Architecture

Element	Definition
Base	Butter (finishing fat)
Primary driver	Green bean; vegetal-fresh
Acid	None — lemon zest is aromatic, not acid
Aromatic/finish	Lemon zest (volatile citrus + slight bitterness); optional garlic

No-acid by design: fresh-finish component; brightness is aromatic (zest), not acidic. Meal acid lives in horseradish and jus.

Texture

Two distinct — firm snap vs. tender core, held by blanch-and-shock. The plate's firmest element by design.

Prep Phase

1. Trim beans. Zest the shared lemon (all zest → here); juice the lemon, reserve for adjustments.

Active Cooking

1. Blanch in well-salted boiling water ~4 min — bright green, just tender with snap.
2. Ice-shock immediately — locks color and bite. Drain, dry well.
3. At 6:57: melt butter over low induction, toss beans to warm through ~2 min, add zest off-heat, salt to taste.

Holding & Assembly

Hold drained and dry, room temp, up to 15 min. Beans go into the butter cold and warm through — holding doesn't degrade them.

Critical Control Points

Severity	Failure Mode & Cue	Recovery
Major	Overcooked — blanched too long or not shocked. Cue: olive-drab, limp, no snap	Unrecoverable. Prevention: 4 min max, immediate shock
Minor	Zest added on heat → bitter. Cue: acrid edge	Prevention: zest off-heat only, at the very end

Adjust: Zest is the default for brightness without added sharpness; a few drops of lemon juice off-heat are a valid post-cook correction if it needs lift. Finishing salt at the toss if under-seasoned.

Scaling Notes: Not applicable.

5 · Horseradish Cream

Yield: ~100 ml · Total 5 min · Active 5 min · No heat

Cold, sharp horseradish folded into crème fraîche — the acid-and-heat cutting agent for the rich beef. No-cook, make-ahead.

Ingredients

Ingredient	Amount
Crème fraîche (or sour cream)	100 ml
Prepared horseradish (adjust to heat preference)	2 tbsp
Lemon juice (optional — only after tasting)	½ tsp
Salt (only after tasting)	small pinch

Flavor Architecture

Element	Definition
Base	Crème fraîche
Primary driver	Horseradish heat + pungency
Acid	Crème fraîche tang + vinegar inherent to prepared horseradish; optional lemon
Aromatic/finish	—

Single-stage acid justified: no-cook condiment, acid inherent to the cultured cream and prepared horseradish.

Texture

Meal-level exemption — a smooth condiment; contrast provided across the plate. Its job is flavor (sharp/cold), not texture.

Prep Phase

1. Fold horseradish into crème fraîche. Taste before adding anything — prepared horseradish already carries vinegar and salt. Then adjust: pinch of salt if flat, lemon if it needs lift, more horseradish for bite.

Active Cooking

None.

Holding & Assembly

Fridge, covered, up to several days. Serve cold, straight from the fridge — the cold contrast against hot beef is part of its function.

Critical Control Points

Severity	Failure Mode & Cue	Recovery
Minor	Too hot or too flat. Cue: overwhelms, or reads as plain cream	Fully adjustable: more crème fraîche to soften, more horseradish to sharpen

Adjust: Entirely tunable before service — soften with crème fraîche, sharpen with horseradish, brighten with lemon. Taste before salting.

Scaling Notes: Not applicable.

6 · Red Wine Jus (Staged, Independent Reduction)

Yield: ~150 ml · Total ~45 min across stages · Active ~15 min · Outdoor gas

A concentrated red-wine-and-stock reduction built on browned shallot — not dependent on roast-pan fond, which a 250°F roast won't reliably produce. Staged with a hold to preserve the make-ahead without over-concentrating. Low-roast and post-blast drippings fold in as available. Reduced to a light nappe, mounted with cold butter.

Ingredients

Ingredient	Amount
Red wine (drinkable)	150 ml
Beef stock	300 ml
Shallot, finely sliced (default base)	1
Beef trimmings (optional additive for extra meat fond)	—
Neutral oil (for browning)	a little
Butter, cold, cubed	20 g
Beef drippings, as available (low-roast + post-blast)	—
Salt + pepper	to taste

Flavor Architecture

Element	Definition
Base	Browned shallot fond (+ optional trimmings), built independently in the saucepan
Primary driver	Reduced beef stock + wine depth
Acid	Red wine — staged early, reduced; acidity mellows and integrates
Aromatic/finish	Cold butter mount for gloss + body

Acid staged correctly: wine in early, reduced to depth not sharpness.

Texture

Meal-level exemption — a sauce; target is a light-syrup nappe coating a spoon back.

Prep Phase

1. Finely slice 1 shallot. If using trimmings, have them ready.

Active Cooking (staged)

1. Stage 1 (~4:45pm): brown shallot (+ optional trimmings) in a little oil over medium until deeply colored. Deglaze with wine, scraping the pan; reduce by half, ~5 min. Add stock, bring to a brief simmer, then off heat, covered.
2. Stage 2 (~6:05pm): return to gas, finish reducing to ~150 ml, lightly syrupy. Fold in low-roast drippings once the beef pulls.
3. Stage 3 (~6:40–6:43pm): off-heat, whisk in cold butter for gloss. Strain. Taste — salt sparingly (stock + drippings already salty). Hold warm on lowest gas.
4. After the beef's blast, pour any last drippings into the finished sauce and re-warm briefly.

Holding & Assembly

Warm on lowest gas up to 30 min. If sticky, loosen with a splash of stock and re-strain.

Critical Control Points

Severity	Failure Mode & Cue	Recovery
Major	Over-reduced sticky/salty — reduced too far, or not held between stages. Cue: coats too thick, concentrated-salty	Loosen with stock/water; don't add salt. Prevention: stage with the off-heat hold; taste before final reduction
Minor	Butter mount breaks — added on too-high heat. Cue: oily, split	Off-heat, whisk in a splash of cold stock to re-emulsify

Adjust: If flat, a few drops of reserved lemon juice or a splash of wine lifts it. Salt last and sparingly — reduction concentrates existing salt.

Scaling Notes: Not applicable.

Meal Balance Audit

Richness: beef + duck fat + butter jus — high, relieved by green beans (fresh-firm reset), horseradish (cold sharp cut), and lemon zest aroma. Acid: horseradish (cultured cream + vinegar) and wine reduction across the savoury plate; lemon juice as adjustment. Distinct roles throughout — no redundancy. Sweet: carrots (light honey), single and isolated. Texture: crisp potato + beef crust vs. tender beef + soft carrots, green beans as firm anchor. No monotony, no accumulation gap.

Wine Pairing

#	Bottle
1	2004 Château Léoville Barton — verified present in Current cellar, Drink now, window closes 2027 (Drink Soon — genuine urgency). Archetypal roast-beef match; restraint flatters the jus.
2	2015 Clos Apalta — present, Drink now. Bridge/backup — generous for you, elegant enough for HF.
3	2018 Caymus Special Selection — present, Drink now; works but broadens the meal.

Cellar VALID; all three verified present and Drink now in the live Current cellar table (fetch returns snapshot 2026-06-18). Barton service: stand upright in advance, open and taste, then decant off the sediment only if sound — don't assume it needs prolonged air; a 22-year bottle can fade fast.
